Central Intelligence – Weekly Deliverables

Planned scope · For **Greg** · From **Jeanne** · **VAPH** · Week of July 27, 2026

TL;DR

Nine focus areas for next week: marketing pages (social media, email campaigns, funnels, ads, offers) rebuilt around the synced database, richer filtering on Insights and Market Signals, an interactive AI Analyst chat, and fine-grained source attribution for leads and sales.

1. Marketing – Social Media

- Rebuild the CI social media page to **match Greg's own tracking page** — using his version as the spec (layout, metrics, structure) and mirroring it 1:1.

2. Marketing – Email Campaigns

- **Remove the Compose Email feature** from the emails section.
- Add **campaign metric filters**: sent, opens, clicks, plus any other engagement fields available in the database.
- Add a **visual performance indicator per campaign** — how each campaign performed at a glance.
- Add **campaign performance ranking** — rank campaigns by how well they performed within a selected time period, based on when they were active, to show which campaigns reached users most effectively.
- Add a **date range filter** for campaigns.
- Add additional filters — **date, campaign type, and more** — after auditing the database for which fields are filterable.

3. Marketing – Funnels *(new section)*

- Explore the database for the funnel data already synced.
- Design and build a funnels view based on what is actually there.

4. Marketing – Ads *(new section)*

- **Remove the platform breakdown** widget.
- Pull ads data exactly as it exists in the database and build the ads view from it.

5. Offers

- Review the offers already synced in the database and study how the data is structured.
- Design how offers should be presented on the frontend, then build it.

NOTE

Funnels, Ads, and Offers each begin with a database discovery step — their final scope depends on what data is actually synced, so these sections are intentionally exploratory.

6. CI Insights Page

- Keep and expand the **visual representation** of insights.
- Add **full filtering** to the insights table (all applicable filters).
- Add **insight source attribution** — show where each insight came from (calls, emails, and other sources).
- Add a **date range filter** on when insights were generated.

7. Market Signals Page

- Add the same filter set as Insights (date range and others).
- Study the market signals data further and redesign the page so it reads as genuinely informative data, not raw output.

8. AI Analyst – "Analyze with AI"

- Make it **interactive**: add a chat interface so follow-up questions can be asked about the currently filtered data after the initial analysis.

9. Leads & Sales – Source Attribution

- Revisit the **source column** on leads and sales.
- Parse and surface `utm_source`, `utm_medium`, `utm_campaign` — and any other UTM parameters present — instead of the generic source label.
- Goal: fine-grained, specific attribution for every lead and sale.
