New Client **Discovery** Checklist

RE Central Intelligence onboarding — what we need from your team

FOR The client team

FROM Virtual Assistants Philippines

DATE 2026 · Prepared 2026-07-15

New Client **Discovery** Checklist

Onboarding · For **the client team** · Virtual Assistants Philippines · 2026

What we need from a new company before their Central Intelligence instance can be built. Items are grouped by who typically answers them.

READ-ONLY PROMISE

Nothing here requires write access to any client system. Central Intelligence only ever *reads* from the client's database — read-only access is enforced at the connection level.

1. Database access

Who answers Technical contact

WHAT WE NEED

- ☐ **Read-only Postgres role** on your Supabase project (or other Postgres), and its connection string (host, port, database, user, password).
A dedicated role limited to SELECT is strongly preferred — CI additionally forces READ ONLY at the session level, but least-privilege is the rule.
- ☐ Permission to **dump the schema** (tables, columns, keys, row counts) and to sample a small number of rows per table for mapping purposes.
- ☐ Confirmation of **which tables are actively synced and populated** — is everything in the business really landing in this database, or are some systems not wired in yet? List anything missing.
- ☐ Any tables we must **exclude** (PII beyond what CI needs, HR, payroll, anything contractually off-limits).

2. Business semantics

Who answers Owner / ops lead — plain-English answers, no technical knowledge needed

WHAT WE NEED

- ☐ What is a **customer** in your business, and where does one live in your data?
- ☐ What is a **revenue event** (a sale, an invoice, a subscription payment, a placement...)? What amount and date fields define it?
- ☐ Who counts as a **team member** whose performance CI should track?
- ☐ What are your **interactions** (calls, meetings, tickets, messages, visits)?
- ☐ What does your **pipeline** look like — the stages a customer moves through, in order, with the exact labels your data uses.
- ☐ The **KPIs you actually run the business on** — ideally the spreadsheet or dashboard you look at weekly. For each: how it's computed and what "good" looks like.

3. Departments & modules

Who answers Owner

WHAT WE NEED

- ☐ What **departments** should CI have directors for? Default: Marketing, Sales, Fulfillment — rename, remove, or add.
- ☐ Which CI modules apply: sales calls / appointments / email marketing / social media / coaching-style QA & scorecards / webinars?
Anything not applicable is simply disabled.

4. Integrations

Who answers Technical or ops contact

WHAT WE NEED

- ☐ Which of these do you use and want connected: Mailchimp, GoHighLevel, Google Workspace (Gmail/Drive/Calendar), Meta Ads, Google Ads, Instagram/Facebook pages?
- ☐ For each: who owns the account and can approve the OAuth/API connection?

5. Branding & setup

Who answers Owner

WHAT WE NEED

- ☐ Product name to display (white-label name), logo file, primary brand colors.
- ☐ **Currency** and **timezone** for reporting.
- ☐ Domain or subdomain for the app (e.g. `ci.yourcompany.com`) and who manages DNS.
- ☐ **Admin users:** names + emails of the people who should have admin access.
- ☐ Preferred terminology if different from defaults (e.g. you say "clients" not "leads", "placements" not "sales").

6. Commercial / ops

Who answers Us (internal)

WHAT WE NEED

- ☐ Anthropic/Voyage API budget expectations set with the client.
- ☐ Hosting: new DigitalOcean droplet + Supabase project + Vercel project per client (never shared with any other client).
- ☐ Signed authorization for read-only access to their database.

→ What happens next

WHAT HAPPENS NEXT

Once this is complete: we introspect the schema, propose a data mapping (which of your tables feed which CI concepts), review it with you, run a historical backfill, and turn on hourly sync. Then directors, metrics, and branding are configured to match the answers above.
